Turbo High Temperature Sensor

OE Fit, Form & Function

THTS

The Turbo High Temperature Sensor (THTS) measures temperatures up to 900° Celsius in the exhaust system of the vehicle. The sensing element of the THTS changes in resistance with the changes in temperature. The engine computer measures the resistance and calculates the temperature.

The information received from the THTS is used to control both turbo boost and overall engine combustion.

The THTS should be replaced anytime the surrounding exhaust system is serviced. Always replace a defective sensor with a quality Walker THTS.

The Walker THTS utilizes an OE construction consisting of high temperature metals and ceramics. This allows the Walker sensors to deliver stable and accurate output despite the heat, vibration, and contamination found in the exhaust.

Engine control and
over-temperature protection

Temperature accuracy that meets
or exceeds OE requirements

Long life in extreme conditions: vibration,
contamination, and high temperatures

OE construction with high temperature
metals and ceramics
